

# How to set up and run MS MPI using MS Visual Studios

With Lots of Pictures!

~Michael Puthawala

# Preliminaries, references

- ▶ For a basic tutorial on coding with MPI, check [this](#) tutorial at LLNL.
- ▶ [Here](#) is another, shorter tutorial on compiling and running a simple MPI program using MS-MPI.
- ▶ [Here](#) is a link to the download page for MS-MPI.
- ▶ If you are just looking to download MS MPI and smpd, then you can download them [here](#). If you are feeling saucy, then you can also download the entire MS HPC (high performance computing) pack cluster, but you won't need most of it if you just want to run and debug simple MPI programs.<sup>1</sup>
- ▶ Finally, [here](#) is a link to a forum where you can post questions/problems with your MPI code. This is the official support forum for people using MS MPI.

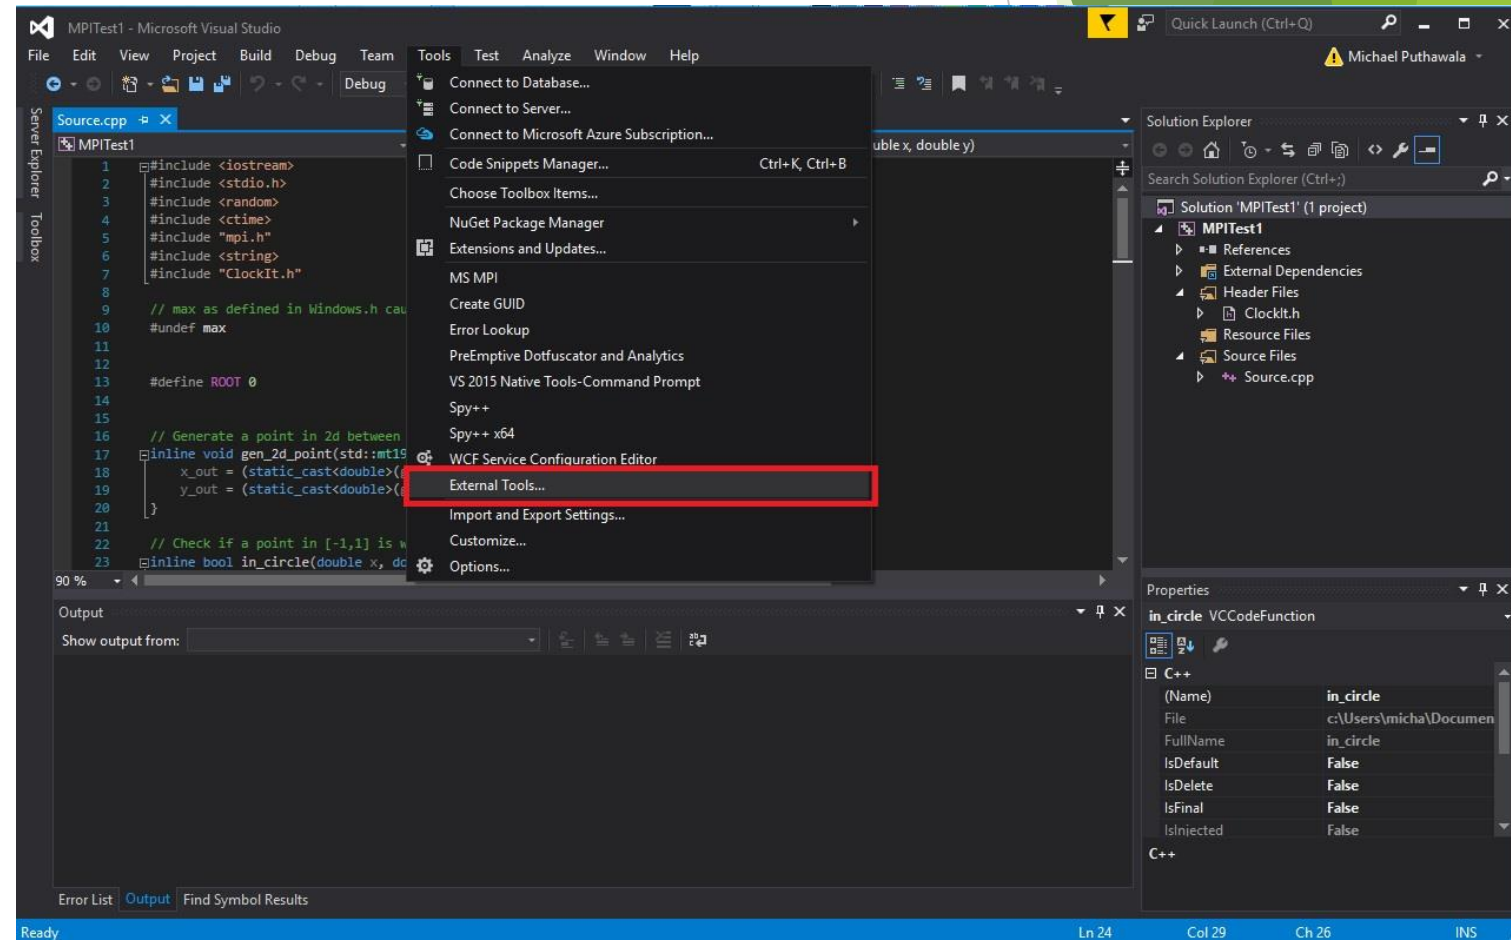

<sup>1</sup> But make sure that you have EXACTLY 1 version of MS MPI installed in either way! If you install both MS MPI and MS HPC you risk having problem further down the line (see slide 7)

# Setting up a native tools command prompt.

- ▶ In order for this to go smoothly, it's useful to have access to a windows command prompt, with the proper configurations.
- ▶ This part will guide you through this process.
- ▶ You can try and use your own cmd.exe. If you don't configure it properly, windows will think that you are a plebeian user, and won't give you access to some powerful commands that you want.
- ▶ The following will let you open a command prompt that is properly configured for your super-user needs.

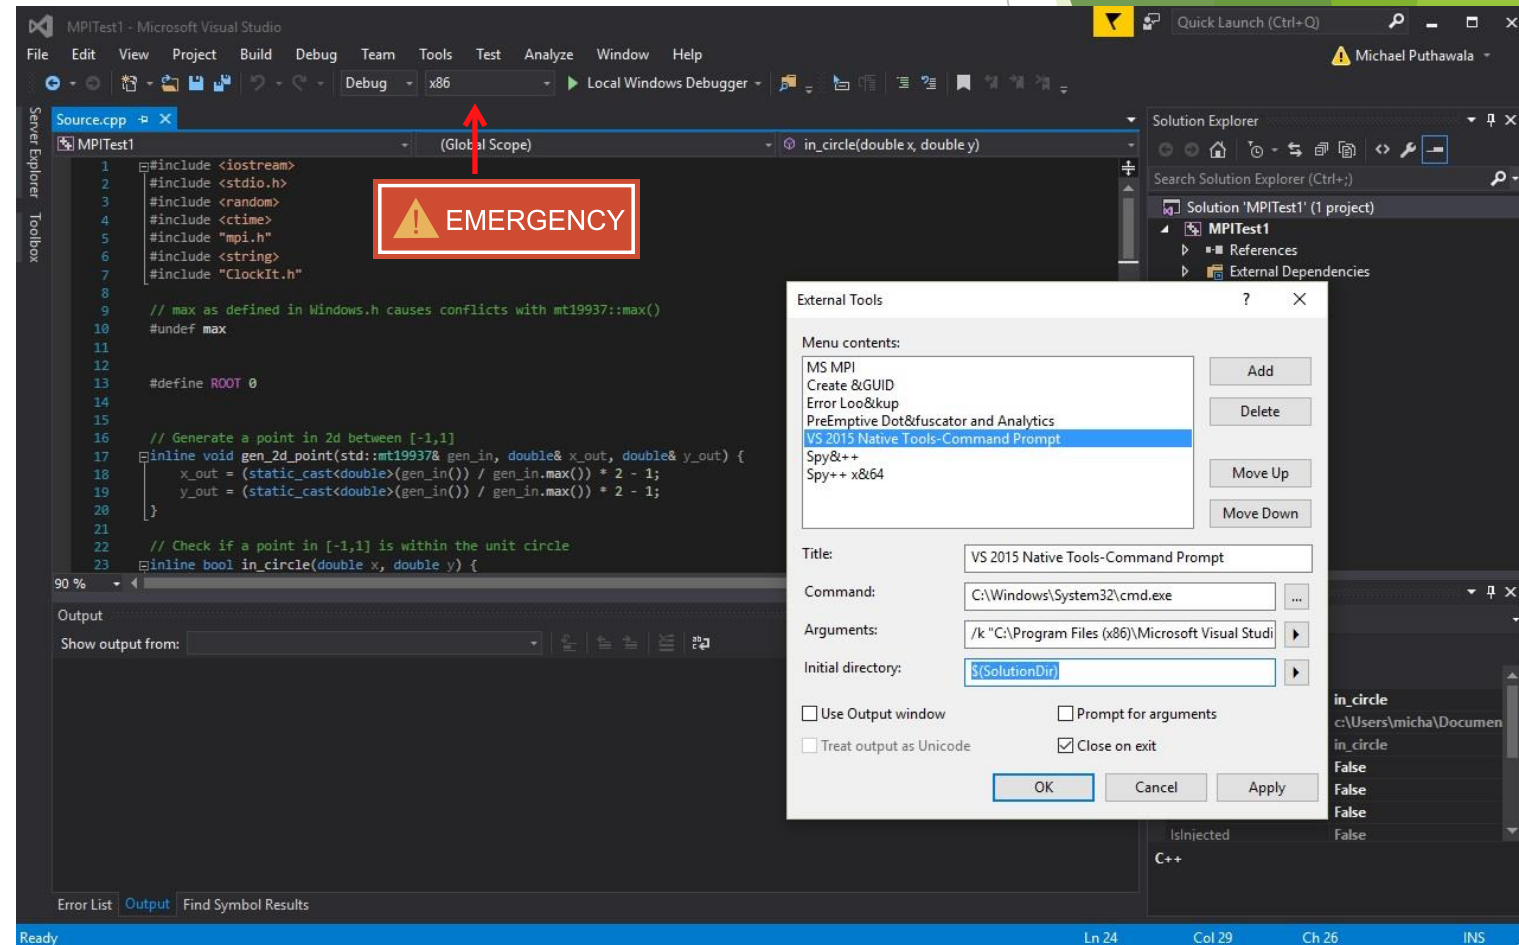

# Setting up a native tools command prompt.

- Open MSVS, and to go tools -> External Tools...

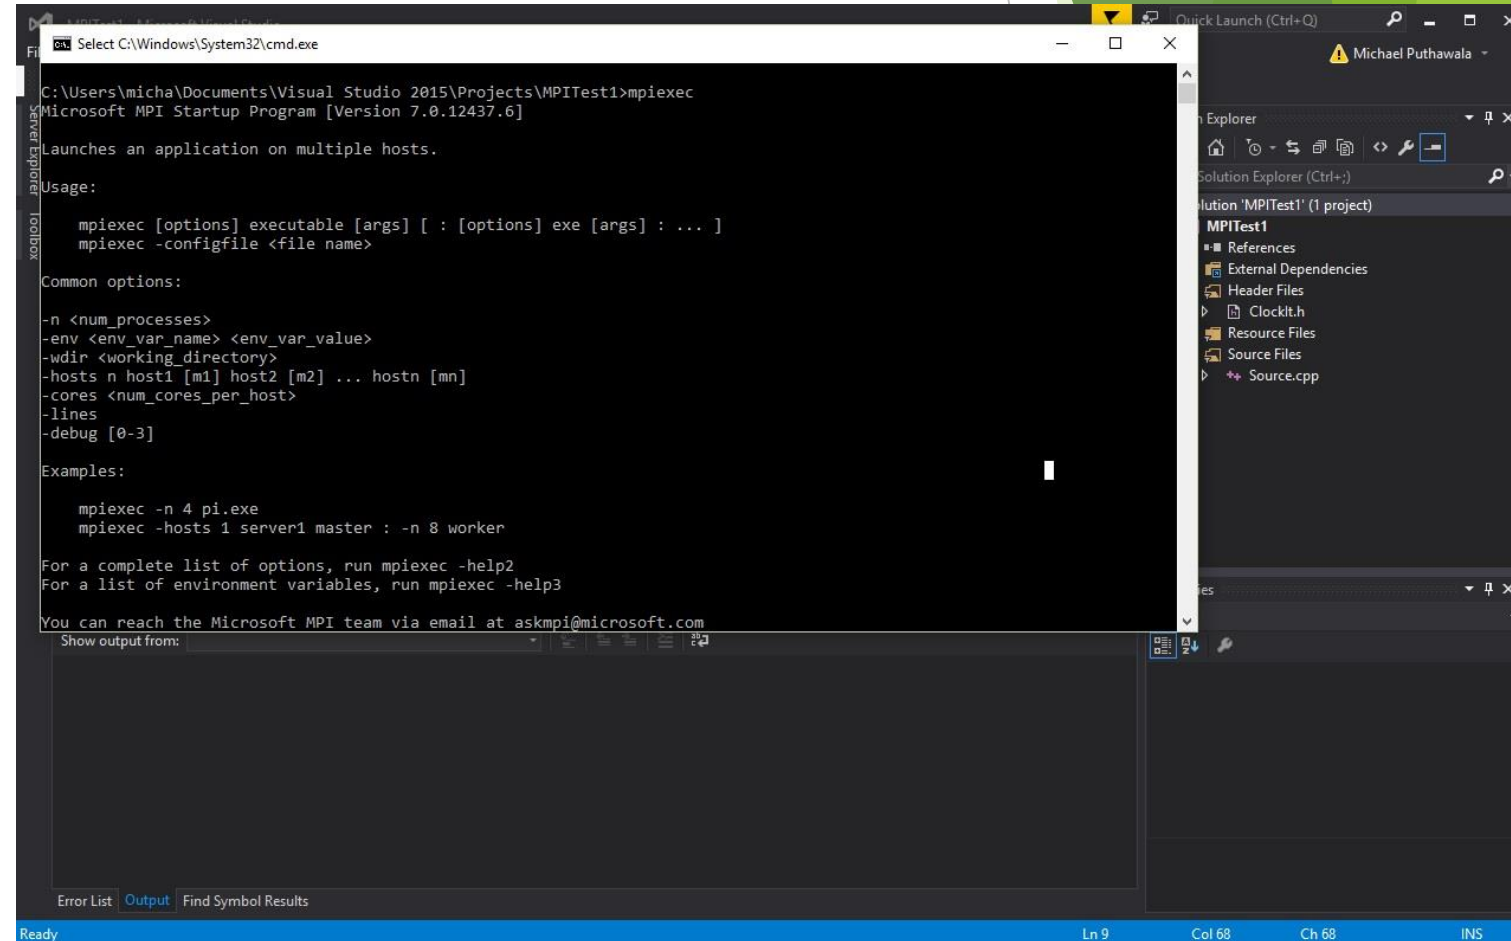

# Setting up a native tools command prompt.

- ▶ Click Add, and fill in the following fields:
- ▶ Title: VS 2015 Native Tools-Command Prompt [or whatever else you want your tool to be called]
- ▶ Command: C:\Windows\System32\cmd.exe
- ▶ Arguments: /k "C:\Program Files (x86)\Microsoft Visual Studio 14.0\Common7\Tools\VsDevCmd.bat"
- ▶ Initial directory: \$(SolutionDir)

# Setting up a native tools command prompt.

- ▶ Now, you should have a new option under Tools. Running your new tool will open a command prompt which is properly configured.
- ▶ Take this opportunity to make sure that mpiexec is in your system's path
- ▶ Type mpiexec into the command prompt, and make sure that you see something like the following

```
Select C:\Windows\System32\cmd.exe

C:\Users\micha\Documents\Visual Studio 2015\Projects\MPITest1>mpiexec
Microsoft MPI Startup Program [Version 7.0.12437.6]

Launches an application on multiple hosts.

Usage:
    mpiexec [options] executable [args] [ : [options] exe [args] : ... ]
    mpiexec -configfile <file name>

Common options:
    -n <num_processes>
    -env <env_var_name> <env_var_value>
    -wdir <working_directory>
    -hosts n host1 [m1] host2 [m2] ... hostn [mn]
    -cores <num_cores_per_host>
    -lines
    -debug [0-3]

Examples:
    mpiexec -n 4 pi.exe
    mpiexec -hosts 1 server1 master : -n 8 worker

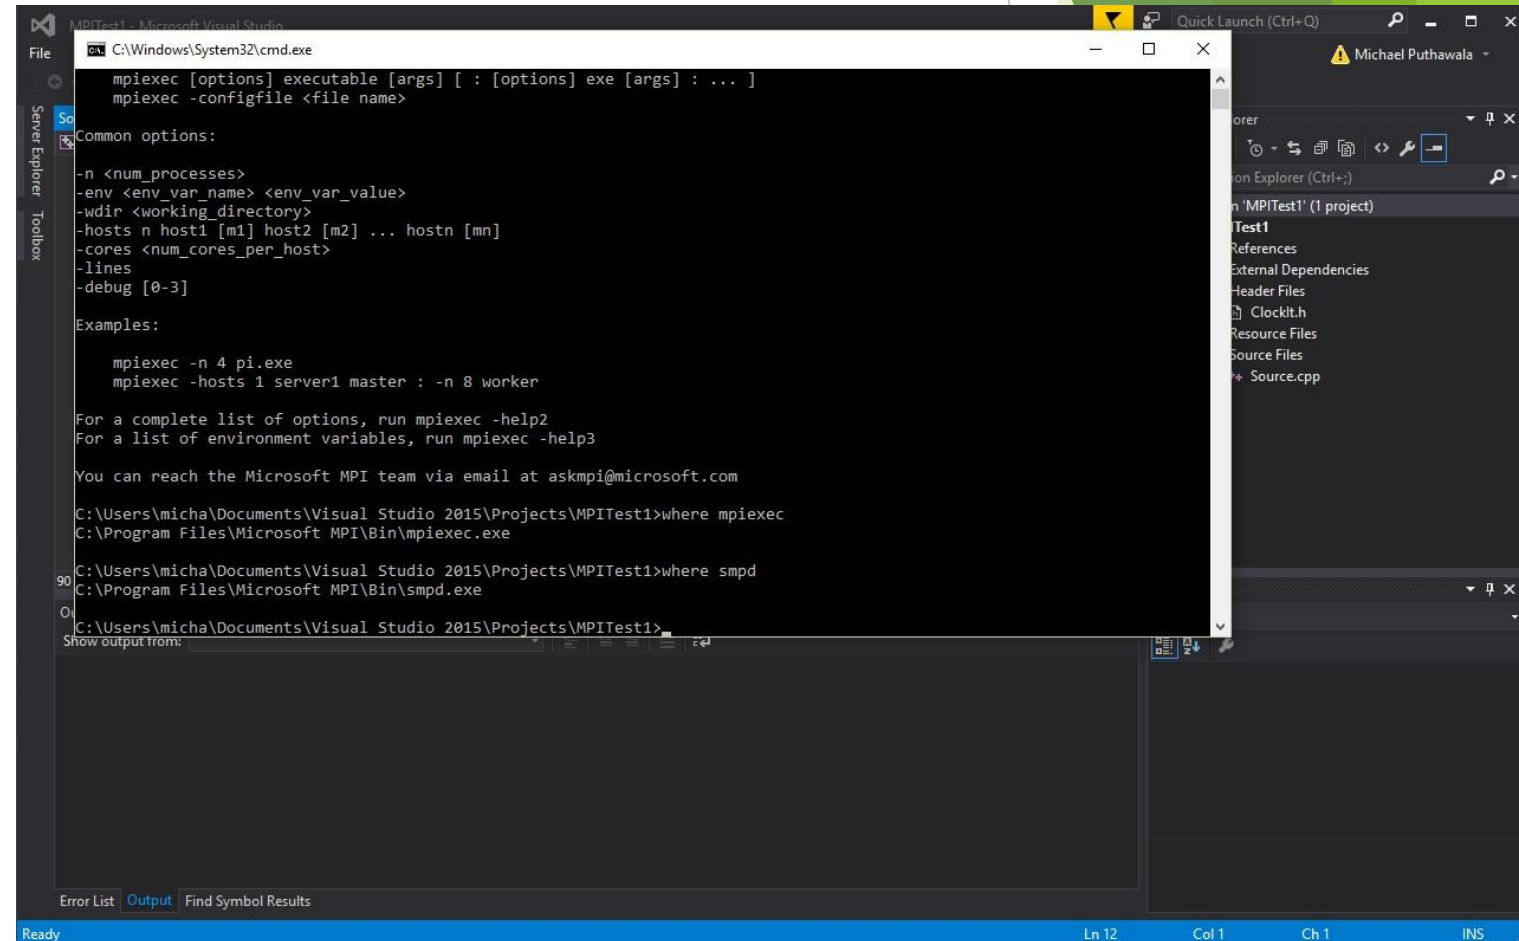

For a complete list of options, run mpiexec -help2
For a list of environment variables, run mpiexec -help3

You can reach the Microsoft MPI team via email at askmpi@microsoft.com

Show output from:
```

# Setting up a native tools command prompt.

- ▶ You should also take this opportunity to make sure that you have exactly one version of mpiexec and smpd installed.
- ▶ Type where mpiexec and where smpd in the command prompt and make sure that you get 1 result.
- ▶ If you have more than 1 version installed, uninstall one or risk a version mismatch.

The screenshot shows a Visual Studio interface with a terminal window titled "C:\Windows\System32\cmd.exe". The terminal displays the following content:

```
mpiexec [options] executable [args] [ : [options] exe [args] : ... ]
mpiexec -configfile <file name>

Common options:
-n <num_processes>
-env <env_var_name> <env_var_value>
-wdir <working_directory>
-hosts n host1 [m1] host2 [m2] ... hostn [mn]
-cores <num_cores_per_host>
-lines
-debug [0-3]

Examples:
    mpiexec -n 4 pi.exe
    mpiexec -hosts 1 server1 master : -n 8 worker

For a complete list of options, run mpiexec -help2
For a list of environment variables, run mpiexec -help3

You can reach the Microsoft MPI team via email at askmpi@microsoft.com

C:\Users\micha\Documents\Visual Studio 2015\Projects\MPITest1>where mpiexec
C:\Program Files\Microsoft MPI\Bin\mpiexec.exe

C:\Users\micha\Documents\Visual Studio 2015\Projects\MPITest1>where smpd
C:\Program Files\Microsoft MPI\Bin\smpd.exe

C:\Users\micha\Documents\Visual Studio 2015\Projects\MPITest1>
```

The terminal window is part of a Visual Studio environment. The background shows the Visual Studio interface with the "Server Explorer" and "Toolbox" on the left, and the "Solution Explorer" on the right. The status bar at the bottom indicates "Ready", "Ln 12", "Col 1", "Ch 1", and "INS".

# Configuring your system PATH variable

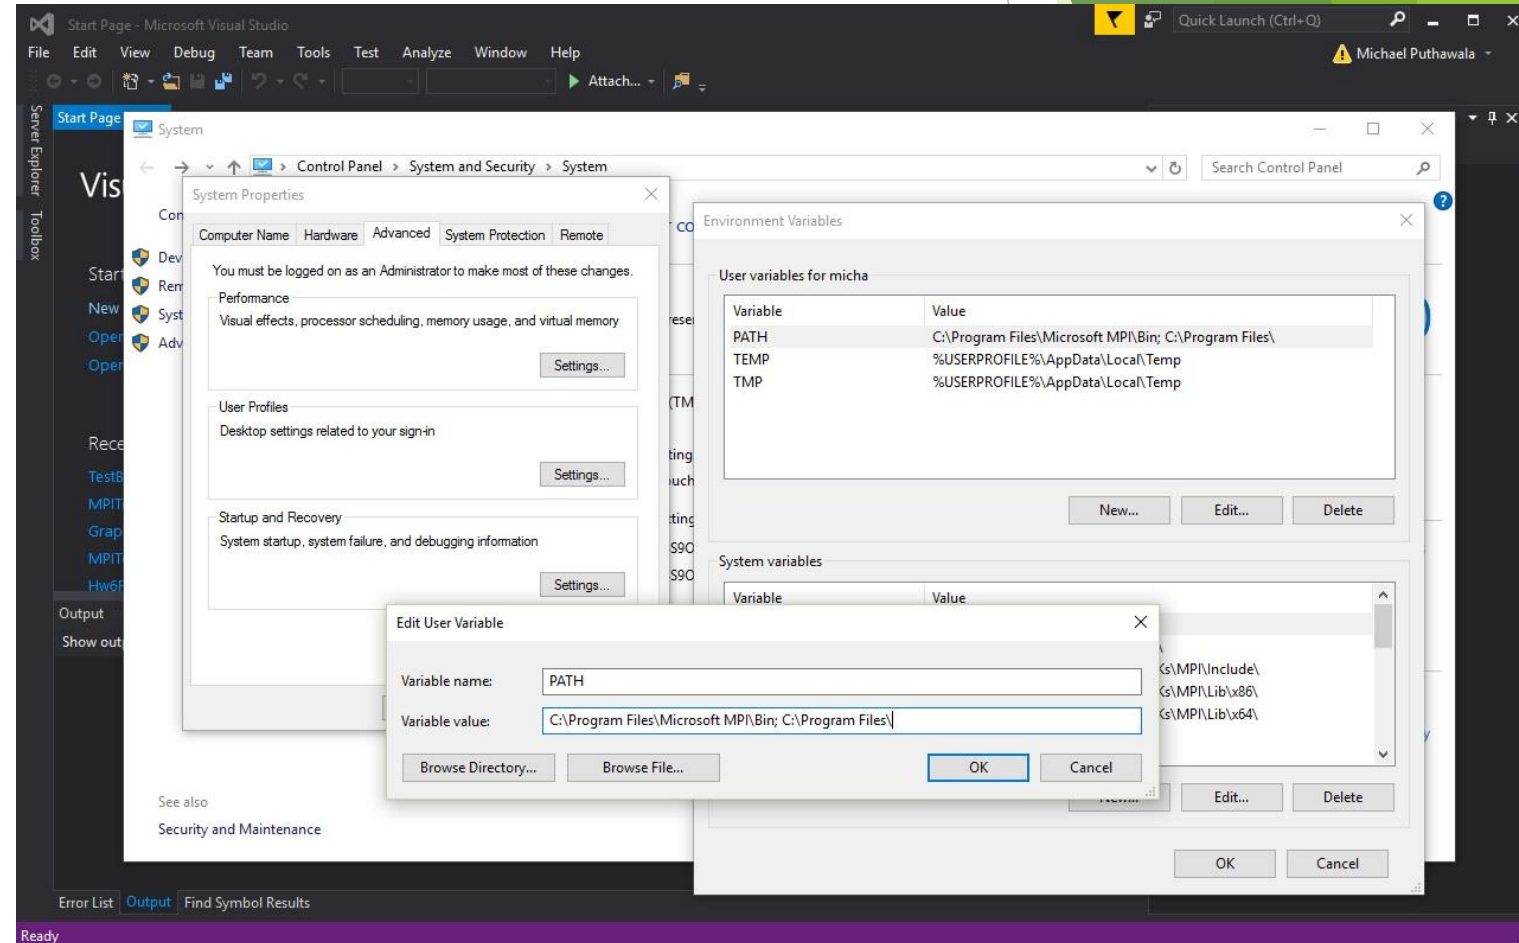

- ▶ If you instead see something like this on the right, then msmapi isn't in the default path for your command prompt.

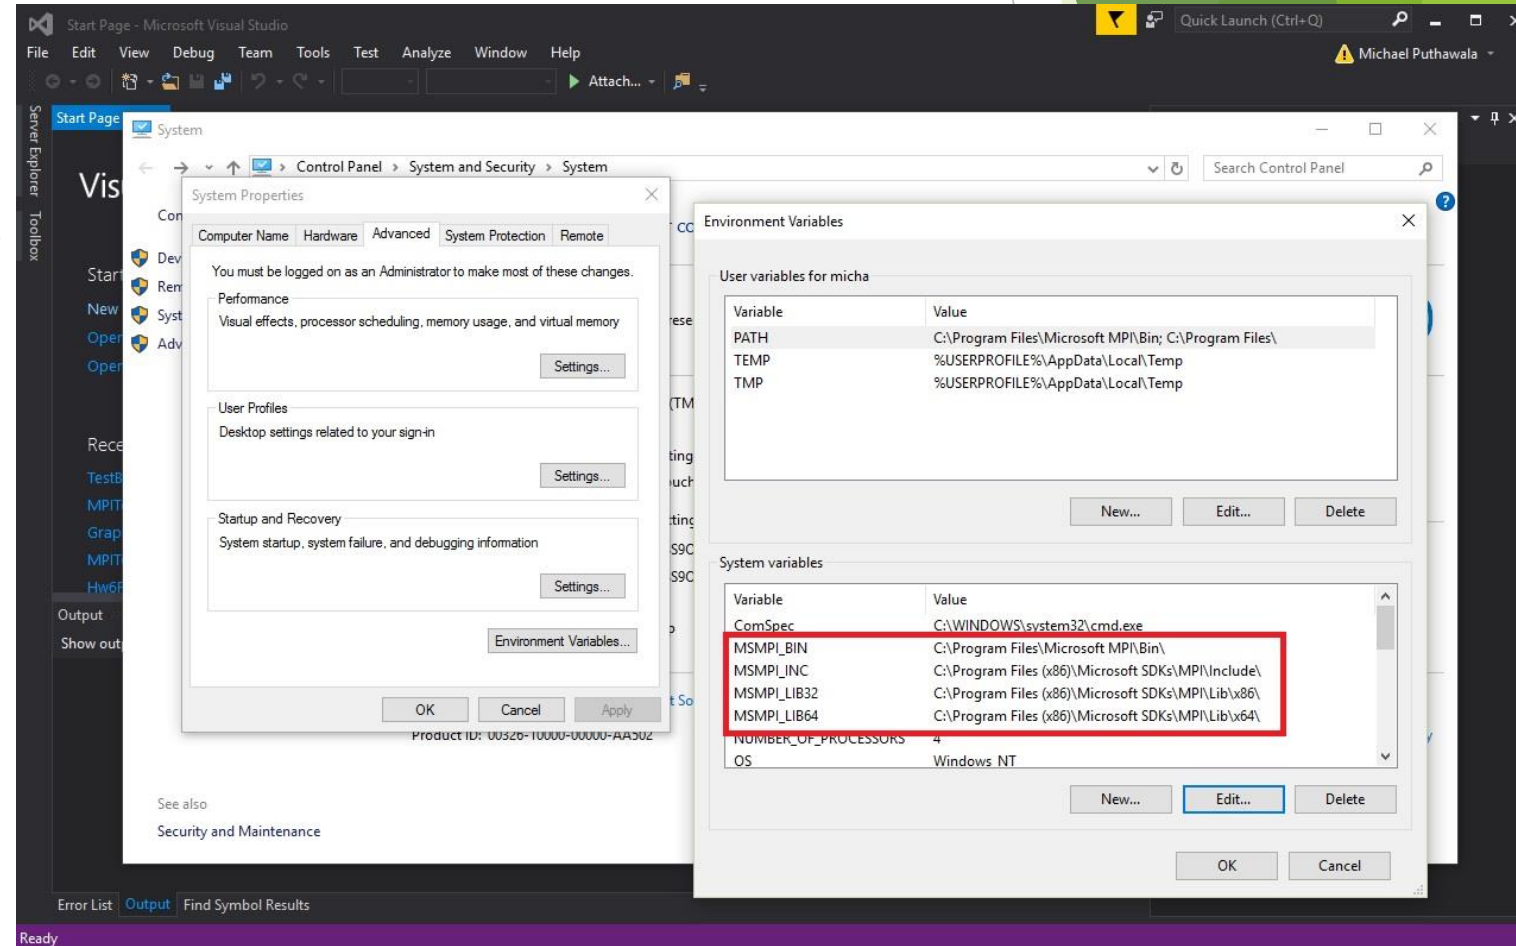

# Configuring your system path

- ▶ There are lots of ways to fix this, but one easy ( and permanent way) to fix this, is to go to control panel -> system -> advanced system properties -> environment variables and add C:\Program Files\Microsoft MPI\Bin to your PATH variable.
- ▶ If you don't have a PATH, then you will need to make a new one
- ▶ If you already have a PATH variable, and don't want to change it, you can add a new path with a ;
- ▶ Then, restart MSVS and try running mpiexec again.

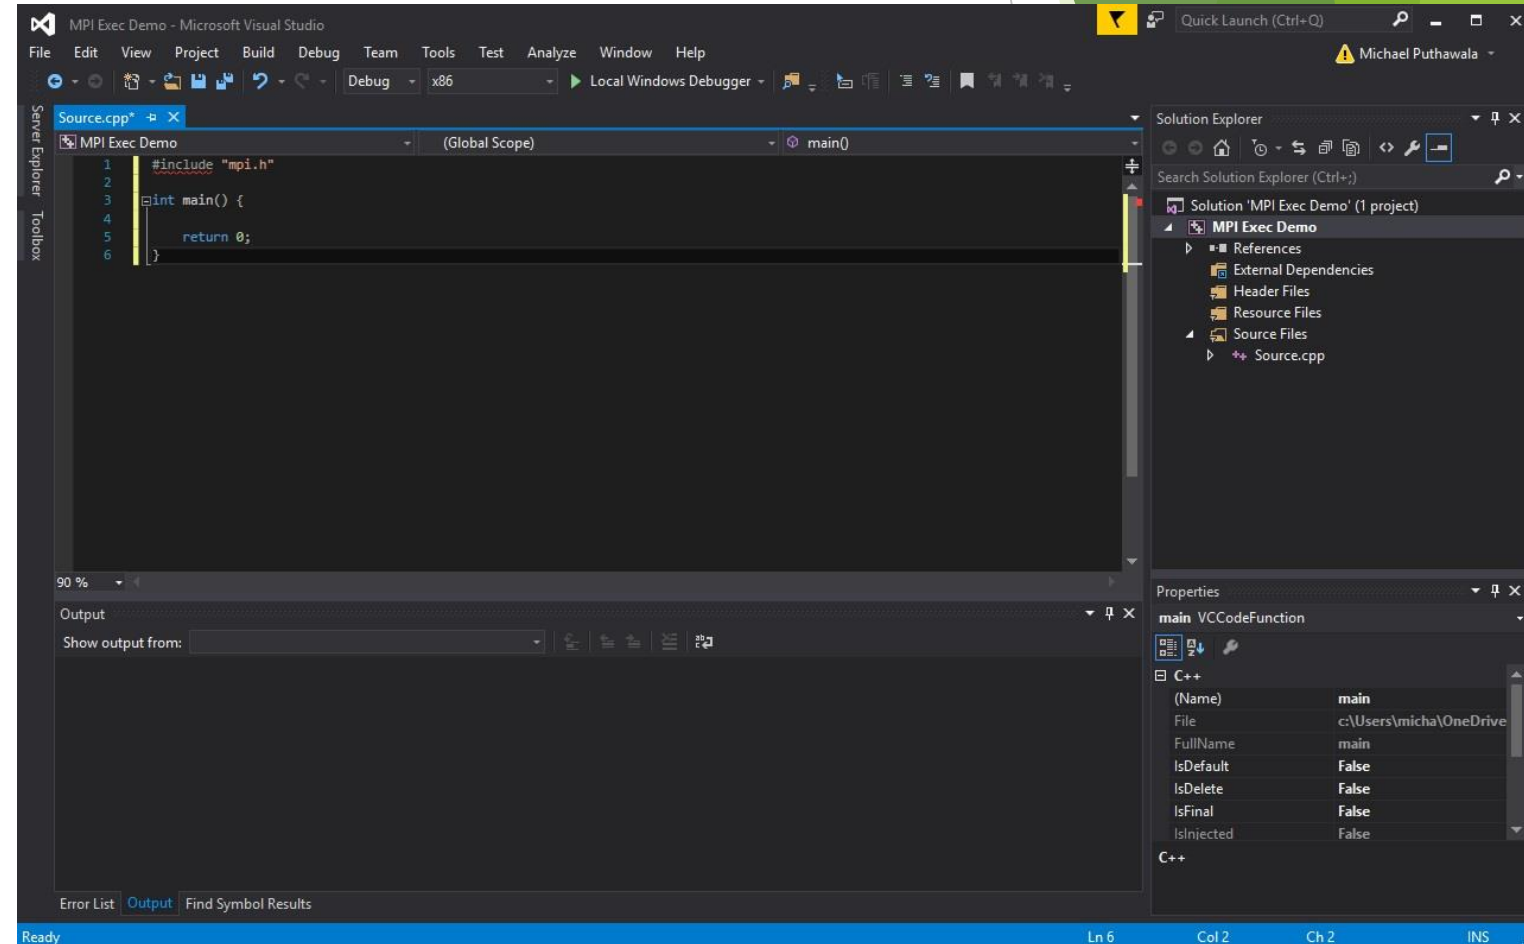

# Configuring your system path

- ▶ You should have some important system variables set, namely MSMPI\_BIN, MSMPI\_INC, MSMPI\_LIB32 and MSMPI\_LIB64.
- ▶ These should have been set when you installed MSMPI.

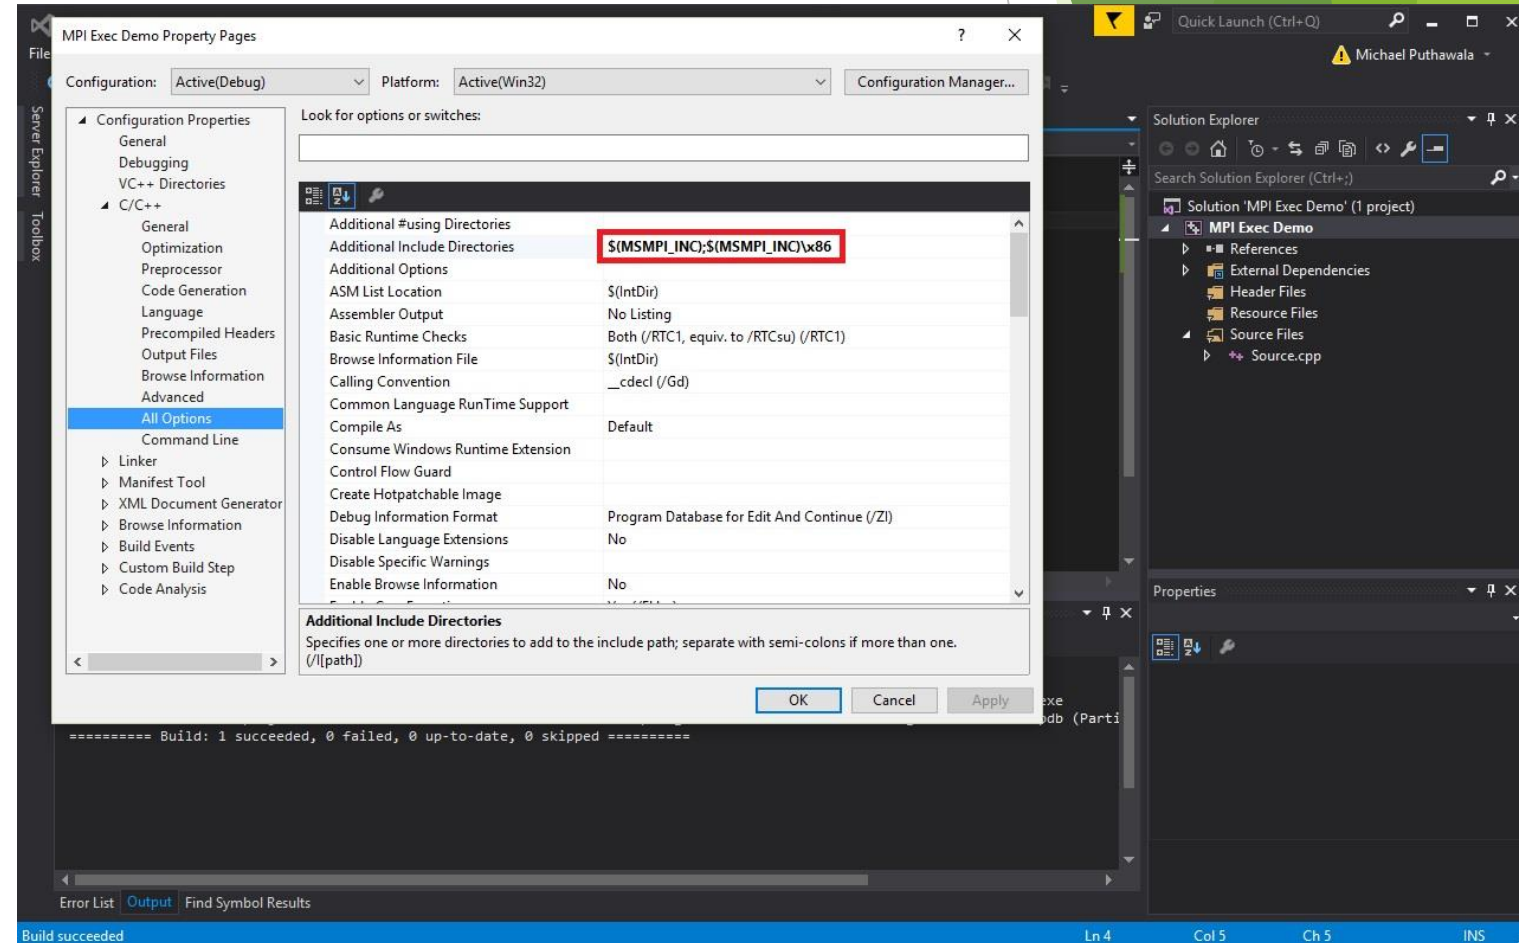

# Setting up your first MPI Program

- ▶ Make sure to `#include "mpi.h"` at the top of your program.

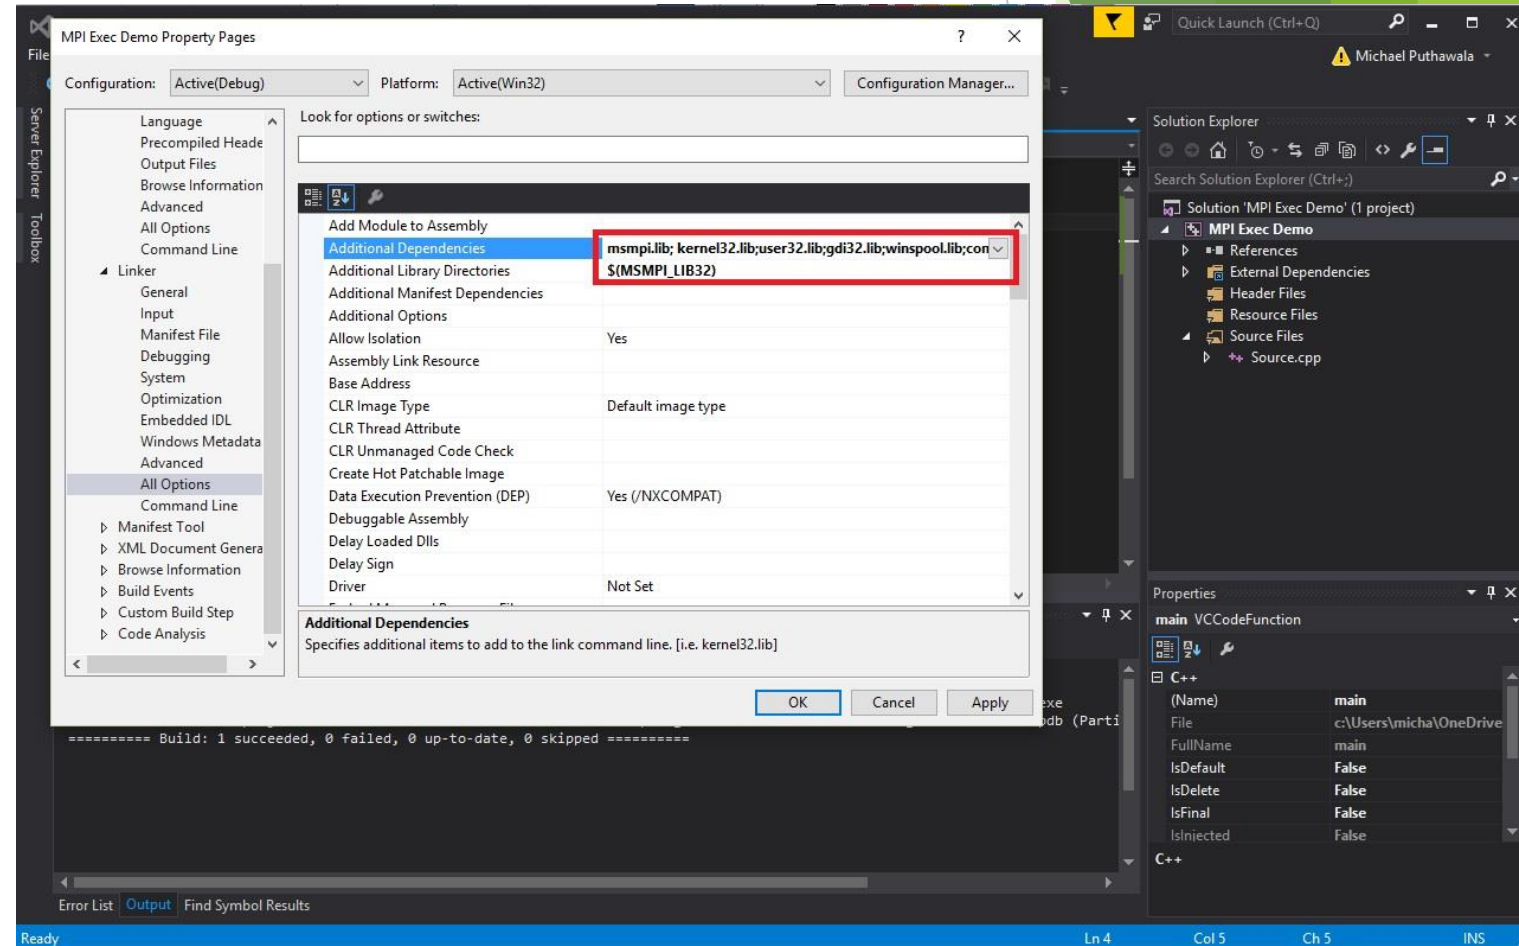

# Setting up your first MPI Program

- ▶ Next, go into Project -> properties -> c/c++ -> All options and add `$(MSMPI_INC); $(MSMPI_INC)\x86` to your addition include directories.
- ▶ Note, if you are using a 64 bit, then replace `$(MSMPI_INC)\x86` with `$(MSMPI_INC)\x64`

# Setting up your first MPI Program

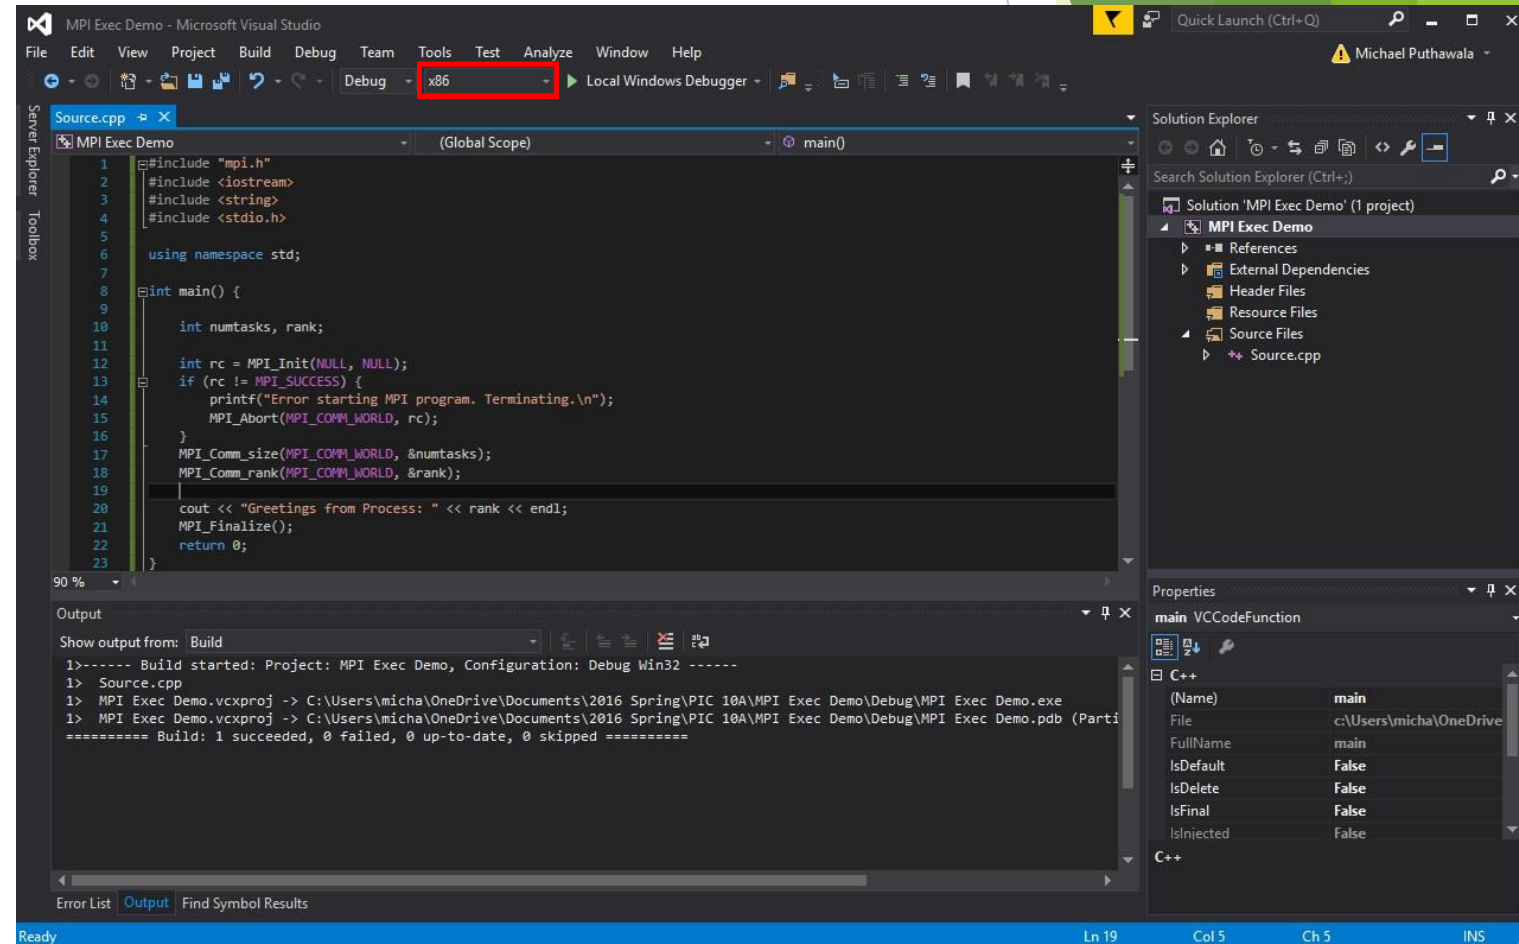

- ▶ Next, go to Project -> Properties -> Linker -> All options and add **msmpi.lib**; to the Additional Dependencies and **\$(MSMPI\_LIB32)** to Additional Library Directories.
- ▶ Again, if you are using 64 bit, then replace **\$(MSMPI\_LIB32)** with **\$(MSMPI\_LIB64)**.

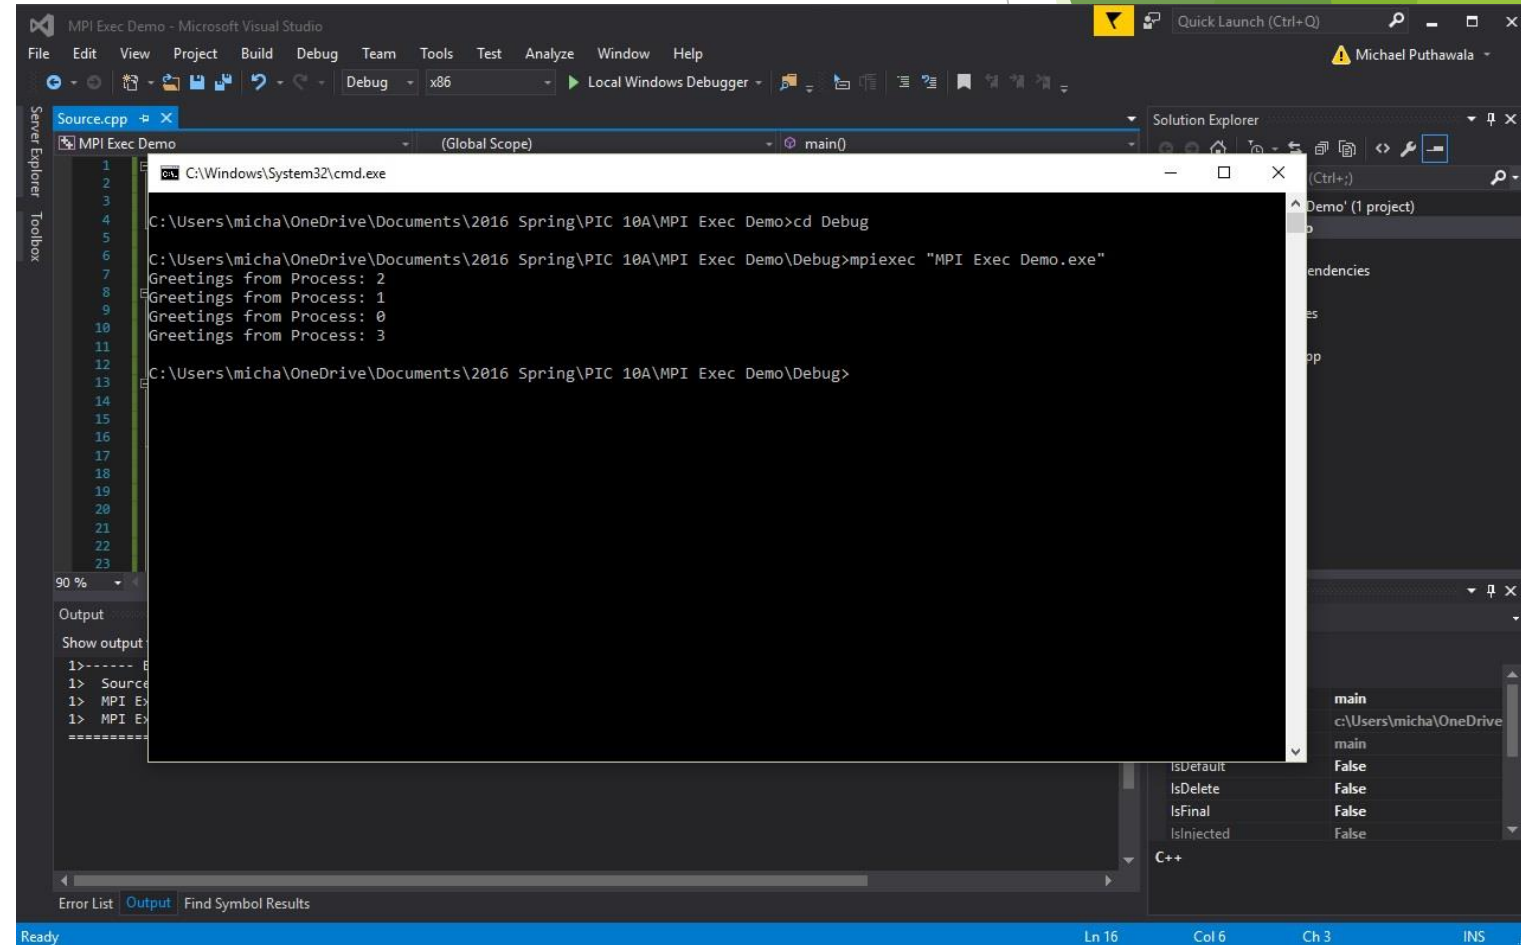

# Setting up your first MPI Program

- Copy the code on the right into your empty project, and make sure that it builds.

# Setting up your first MPI Program

- ▶ Open up for fancy command prompt, cd to the project directory, and run mpiexec on your new program!

The screenshot displays the Microsoft Visual Studio IDE with the 'MPI Exec Demo' project open. The 'Source.cpp' file is visible in the editor, showing a multi-process MPI program. A command prompt window is open, showing the execution of the program using 'mpiexec'. The output shows greetings from three processes (0, 1, and 2). The 'Output' window at the bottom shows the execution details, including the source file and the MPI executable.

```
C:\Windows\System32\cmd.exe
C:\Users\micha\OneDrive\Documents\2016 Spring\PIC 10A\MPI Exec Demo>cd Debug
C:\Users\micha\OneDrive\Documents\2016 Spring\PIC 10A\MPI Exec Demo\Debug>mpiexec "MPI Exec Demo.exe"
Greetings from Process: 2
Greetings from Process: 1

# Setting up 2 click MPI

- ▶ If that process of opening up a new command prompt is too much work for you, then you can add another external tool which will automatically run any of your projects with mpiexec.

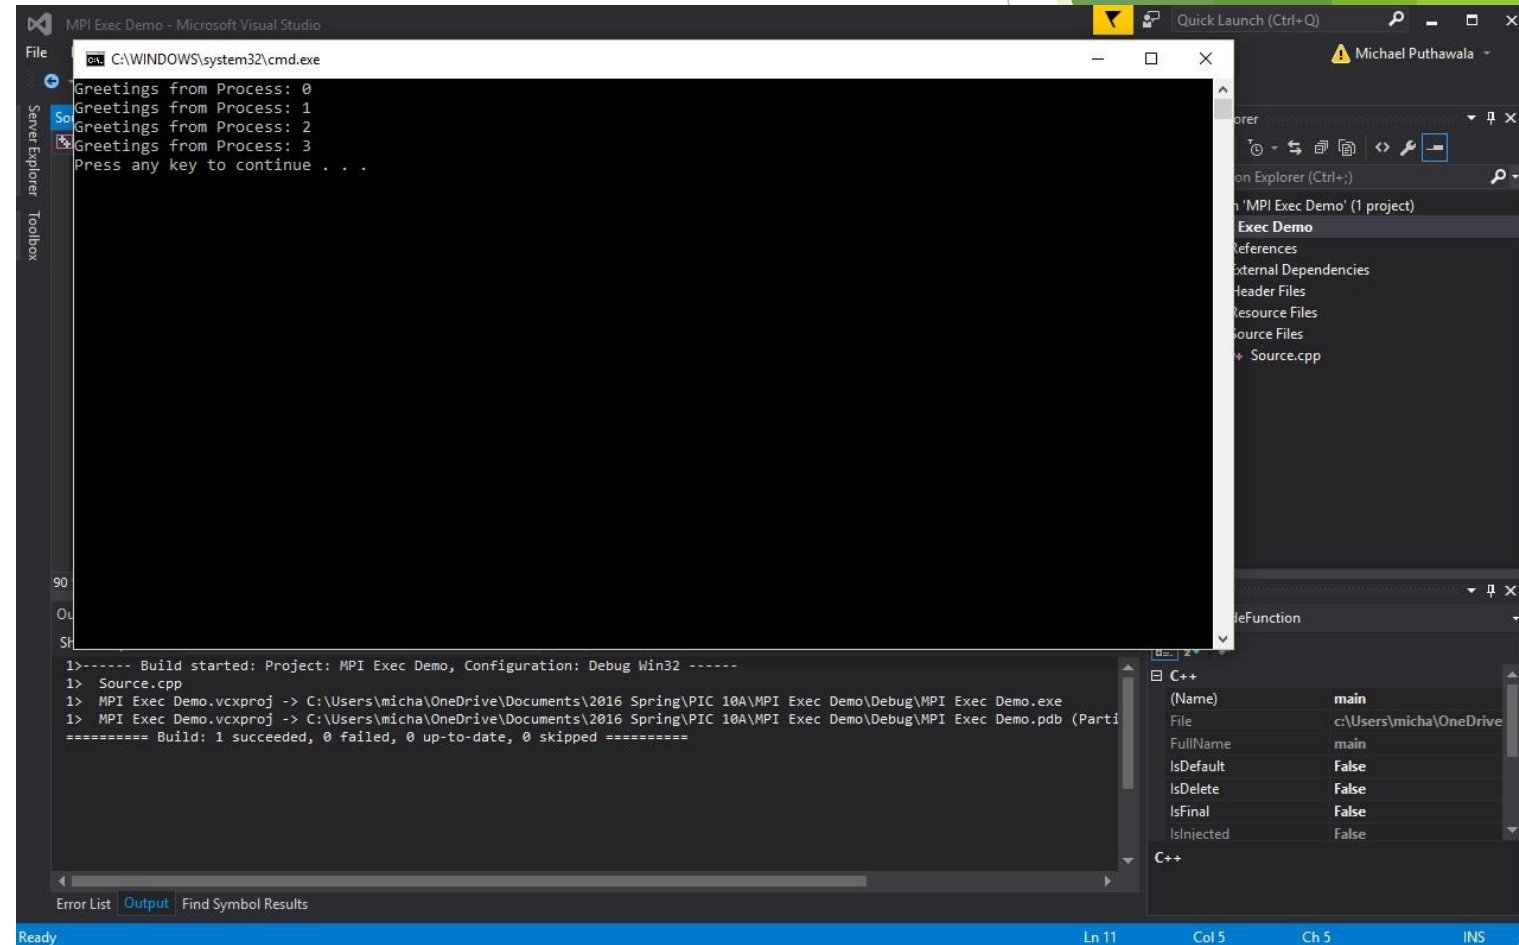

# Setting up 2 click MPI

- ▶ Add a new tool, and specify it using the following:
- ▶ Title: MS MPI
- ▶ Command: `$(MSMPI_BIN)mpiexec.exe`
- ▶ Arguments: `$(TargetName).exe`
- ▶ Initial Directory: `$(BinDir)`
- ▶ Also, make sure that the close on exit button is unchecked.

# Setting up 2 click MPI

- Now if you want to run your MPI Program, you just have to build it, and then click Tools -> MS MPI

```

# Conclusion

- ▶ MPI is very powerful, fun to program with, but a pain in the ass to install and get working on your first project.
- ▶ Hopefully this tutorial make the process of installing/configuring/using MSMPI slightly less terrible.
- ▶ If you have any questions, or this tutorial helped you in some way, don't be afraid to let me know at [michaelputhawala@gmail.com](mailto:michaelputhawala@gmail.com)
